2 - Bedroom Unit 8 units

## Modular Housing

In 2016, Prop HHH was passed which allocated \$1.2 billion <sup>1</sup> to fund 10,000 Permanent Supportive Housing and Affordable Housing projects<sup>2</sup>. Since it was passed, only 1 new project has been built, with 21 other projects currently under construction. It is anticipated that the final number of units will be around 8,000, which is 2,000 fewer than promised<sup>3</sup>. Meanwhile, the homeless population grows rapidly, so more urgent action is needed. We desperately need to save time and materials in order to abate

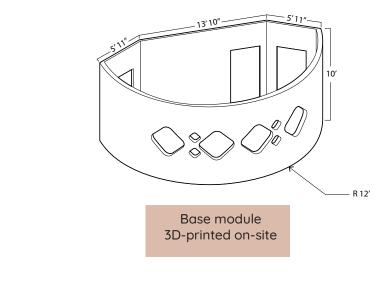

the extremely high rates at which the homeless population is growing in Los Angeles. Modular construction methods can cut construction times 20-50% due to parallel construction methods<sup>4</sup>. This proposal uses modular units that are 3D-printed on site and connected to create different sized apartments. The modules are round because it requires less material than a rectilinear building with the same square footage and the round walls make it better resistant to weather conditions such as wind and floods.

A Gantt chart was used to split up tasks and ensure that all tasks were finished in a timely manner.

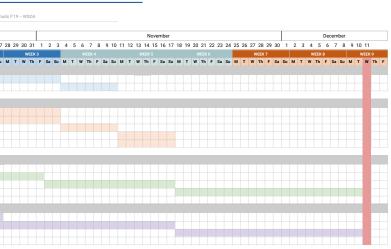

Concrete foundation smoothed with hand-trowel

# Full-Scale Mock - Up With Aileen Zaldana, Jessica Gomez & Sergio Santos

In a group of four, a precedent was studied and First, a concrete foundation was poured and a full-scale mockup of a connection system was smoothed using hand trowels. Aluminum created. The Precedent is S2OSB Headquarters, composite material was drilled, scored, cut, and a concert hall in Sakarya, Turkey. The building has a dynamic and all-encompassing aluminum panel facade, breaking only at the main entrance where a monolithic quartz wall stands, leading the visitor to the door. The fullscale mockup demonstrates this connection.

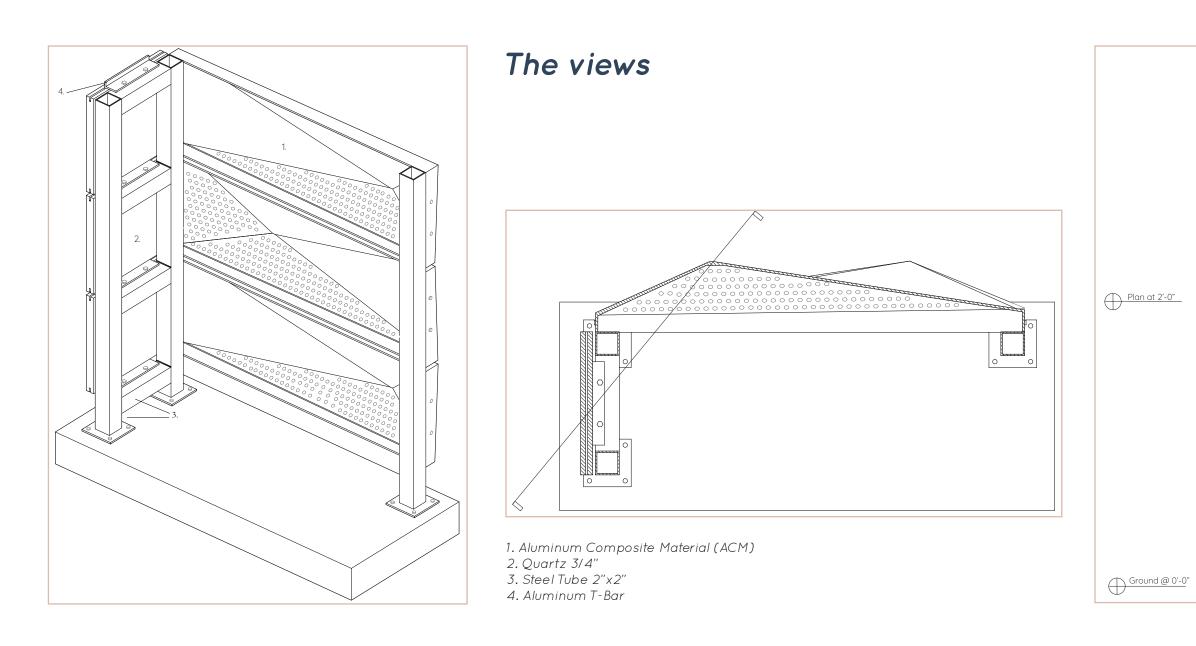

folded to create three panels that mounted on the welded steel structure. Three quartz slabs were slotted at the top and bottom edges and held secure with T extrusions attached to the steel structure.

### Studio 3A Fall 2020 Instructor: Thomas Valle Stallman

Situated on the canals of Venice, California, this housing project aims to make independent living easier for the elderly and those with disabilities by providing a moving vertical platform within each 3-level apartment. A second building contains 16 studio apartments for the unhoused individuals living in Venice.

Solar Futures Residence

Solar Futures is the first permitted 3D-printed structure in Southern California. As part of our entry to the U.S. Department of Energy Solar Decathlon Build Challenge 2023, the Woodbury team set out to address 3 challenges in the housing industry: climate, cost, and homelessless. We designed a net positive house that uses long-lasting, resilient

materials, innovative technology that reduces cost and time and is scalable and modular.

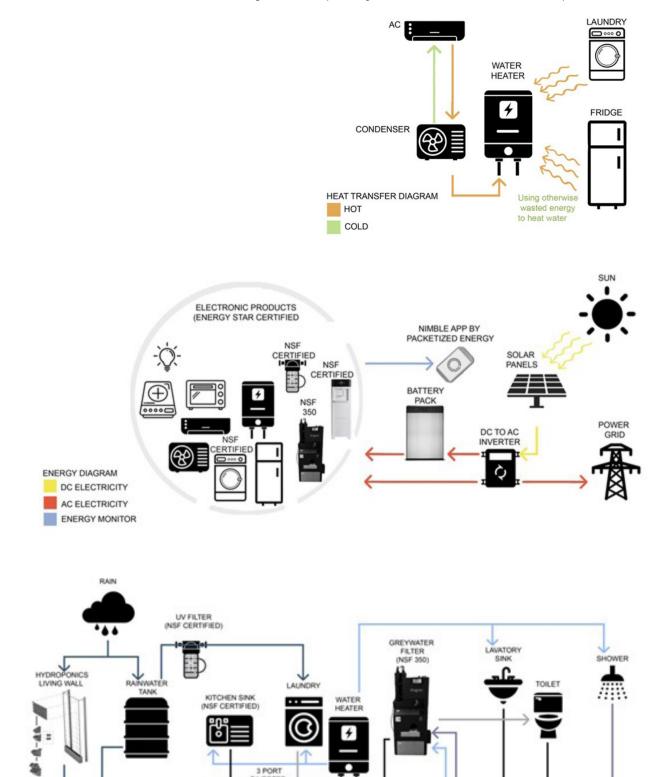

This unit will act as a prototype for 3D-printed dwellings as one possible solution for housing our neighbors.

Corners filleted for more biophilic form and printer efficiencies
